

## Dark / Lite Mode in Figma

In today world every app, not only web even desktop start adopting light/dark theme in their app. As personal I love dark theme, so I expect that need to be present in my apps. So let's see how can we achieve it in figma

### 1. Design Every Element in both mode

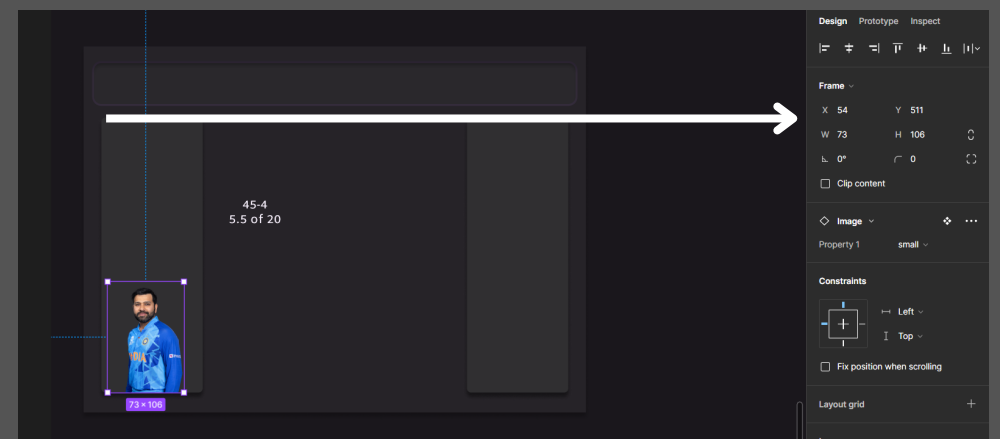

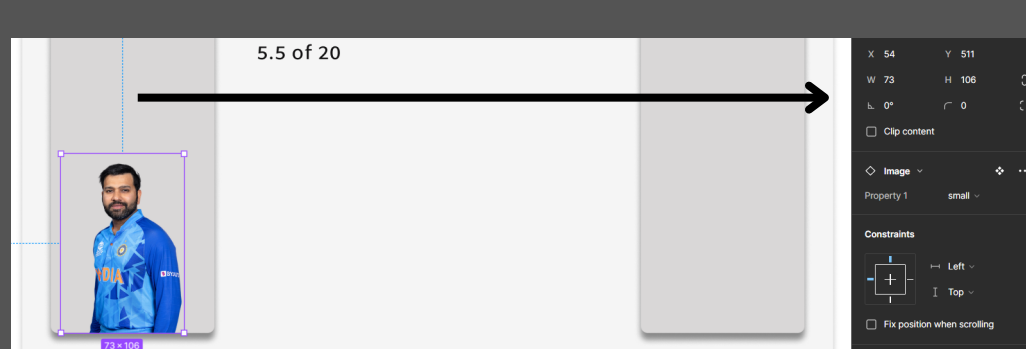

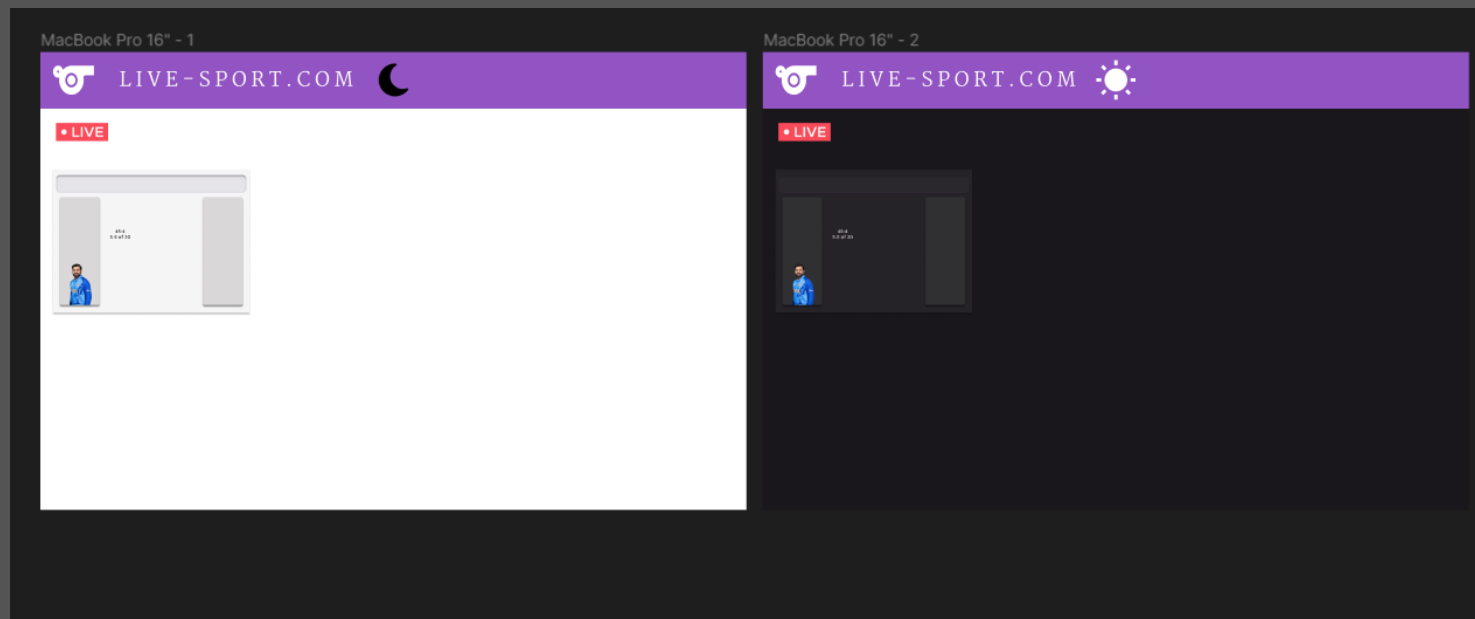

- Design every element/ component in both mode. Choose the color wisely. Combine them as variants. Keep it one for dark mode and lite mode.
- If you want how to create variant, refer my previous post loop animation or google it you can find tons of blogs.

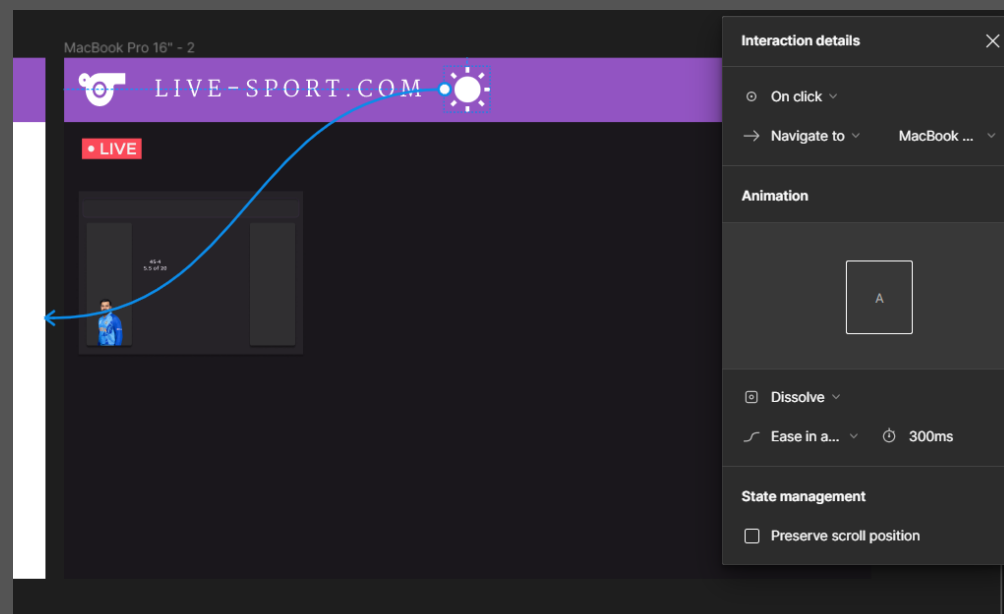

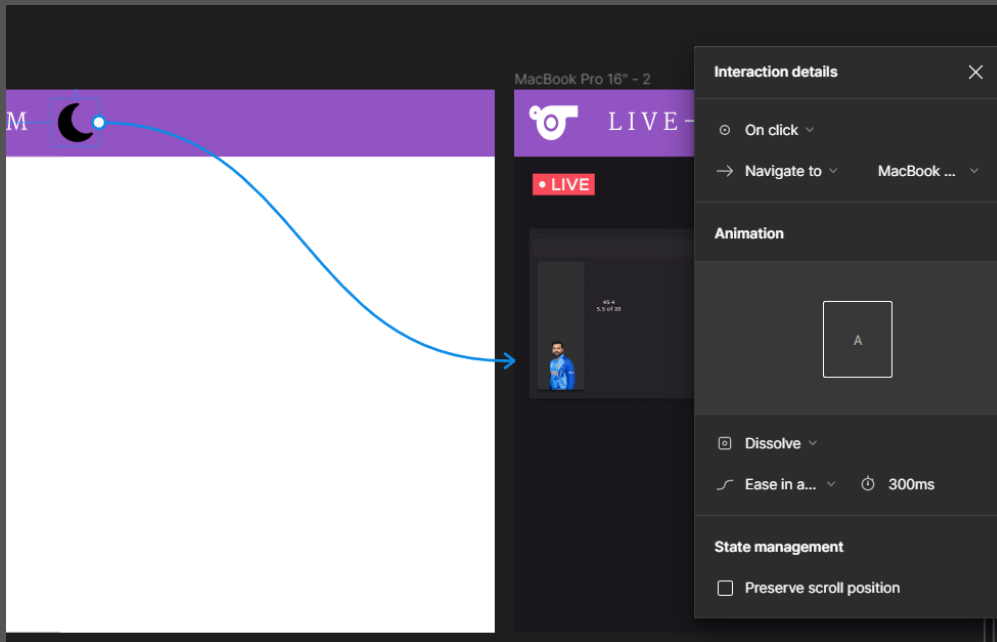

## 2. Place all the elements in seperate frame with accurate position.

- Place all the elements in side by side seperate frame for dark and lite mode with accurate posiiton.
- This means X,Y,width,height are same for both

## 3. Give Prototype settings

- Make the prototype with the following settings

Our output is ready
